Chapter 1 Introduction

A note on the use of these PowerPoint slides:

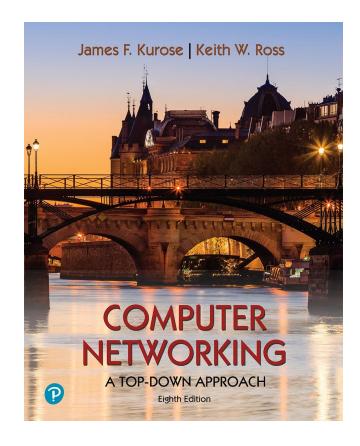

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) that you mention their source (after all, we'd like people to use our book!)
- If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

For a revision history, see the slide note for this page.

Thanks and enjoy! JFK/KWR

Computer Networking: A Top-Down Approach

8th edition Jim Kurose, Keith Ross Pearson, 2020

Chapter 1: introduction

Chapter goal:

- Get "feel," "big picture," introduction to terminology
 - more depth, detail *later* in course
- Approach:
 - use Internet as example

Overview/roadmap:

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

The Internet: a "nuts and bolts" view

Billions of connected computing *devices*:

- hosts = end systems
- running network apps at Internet's "edge"

Packet switches: forward packets (chunks of data)

routers, switches

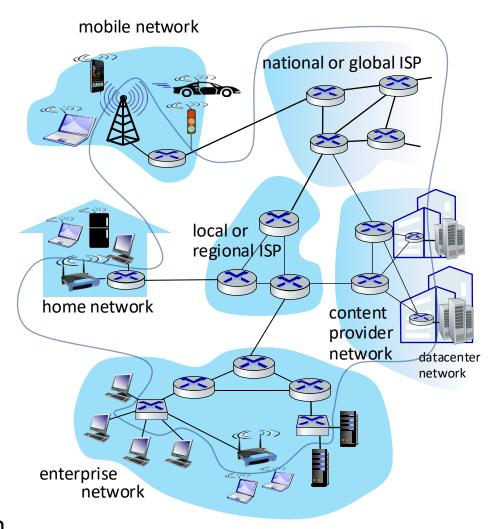

Communication links

- fiber, copper, radio, satellite
- transmission rate: bandwidth

Networks

collection of devices, routers, links: managed by an organization

"Fun" Internet-connected devices

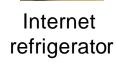

Pacemaker & Monitor

Tweet-a-watt: monitor energy use

Security Camera

Web-enabled toaster + weather forecaster

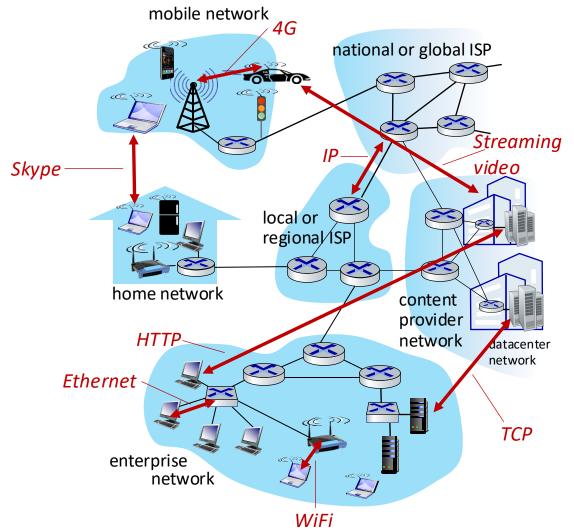

sensorized, bed mattress

Others?

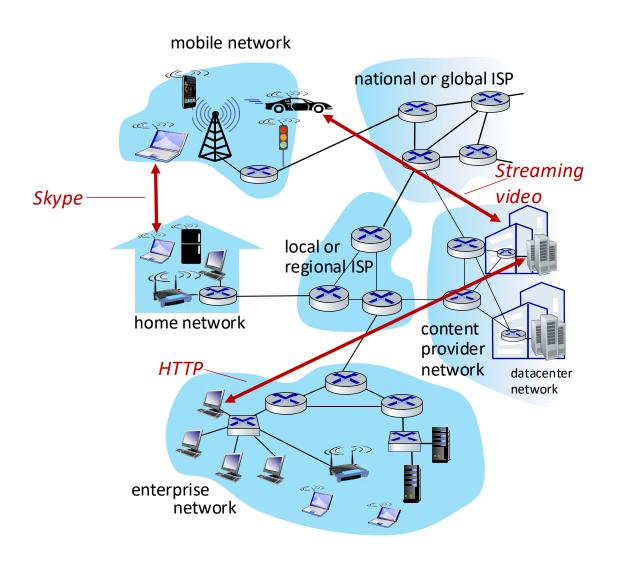

The Internet: a "nuts and bolts" view

- Internet: "network of networks"
 - Interconnected ISPs
- protocols are everywhere
 - control sending, receiving of messages
 - e.g., HTTP (Web), streaming video, Skype, TCP, IP, WiFi, 4G, Ethernet
- Internet standards
 - RFC: Request for Comments
 - IETF: Internet Engineering Task
 Force

The Internet: a "service" view

- *Infrastructure* that provides services to applications:
 - Web, streaming video, multimedia teleconferencing, email, games, ecommerce, social media, interconnected appliances, ...
- provides programming interface to distributed applications:
 - "hooks" allowing sending/receiving apps to "connect" to, use Internet transport service
 - provides service options, analogous to postal service

What's a protocol?

Human protocols:

- "what's the time?"
- "I have a question"
- introductions
- ... specific messages sent
- ... specific actions taken when message received, or other events

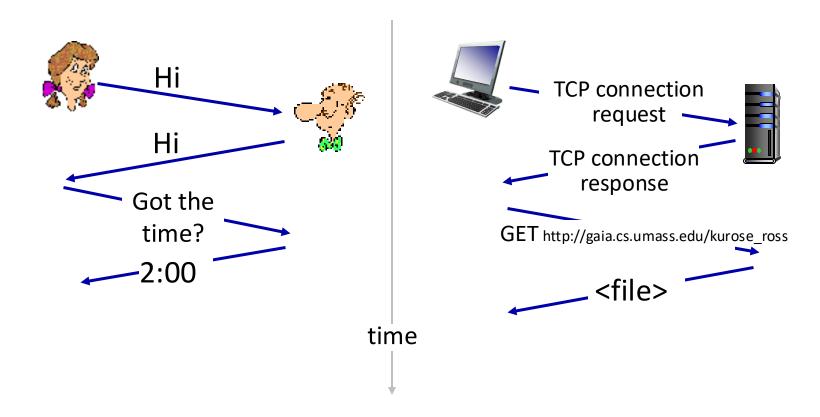

Network protocols:

- computers (devices) rather than humans
- all communication activity in Internet governed by protocols

Protocols define the format, order of messages sent and received among network entities, and actions taken on msg transmission, receipt

What's a protocol?

A human protocol and a computer network protocol:

Q: other human protocols?

Chapter 1: roadmap

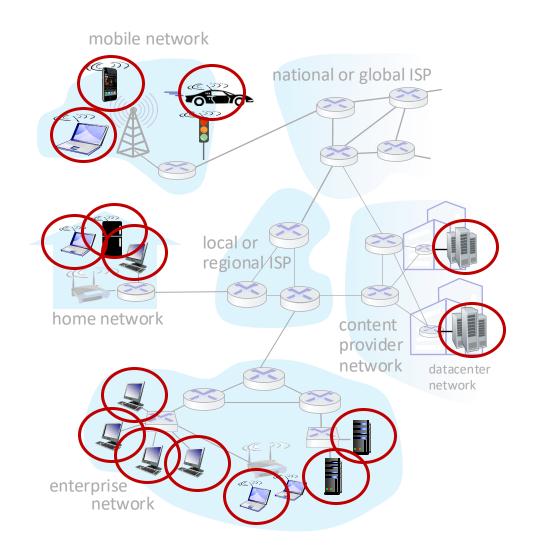

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

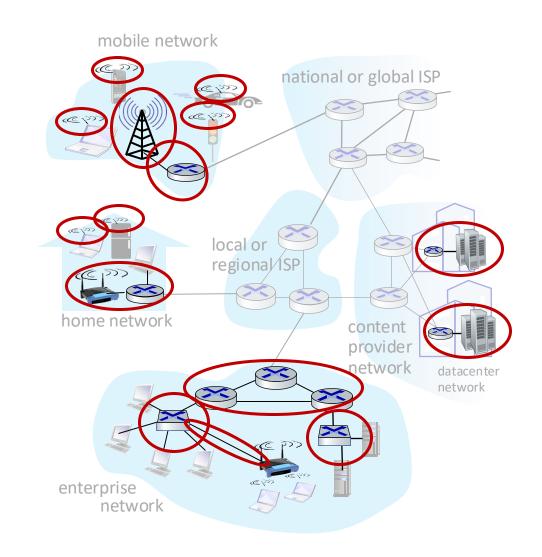

A closer look at Internet structure

Network edge:

- hosts: clients and servers
- servers often in data centers

Access networks, physical media:

wired, wireless communication links

A closer look at Internet structure

Network edge:

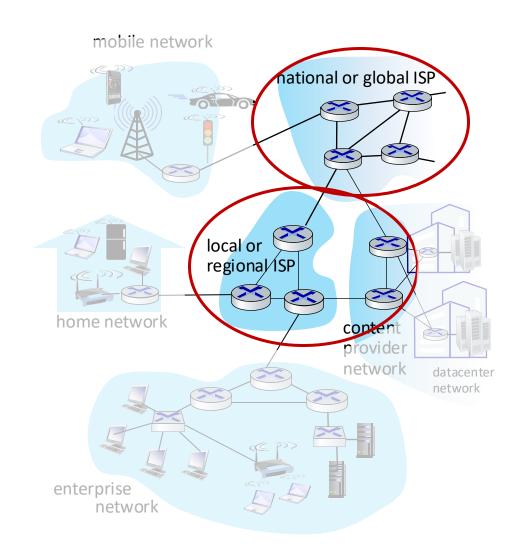

- hosts: clients and servers
- servers often in data centers

Access networks, physical media:

wired, wireless communication links

Network core:

- interconnected routers
- network of networks

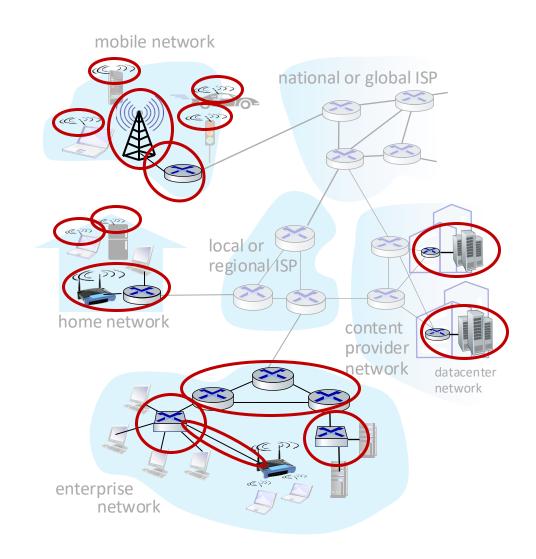

Access networks and physical media

Q: How to connect end systems to edge router?

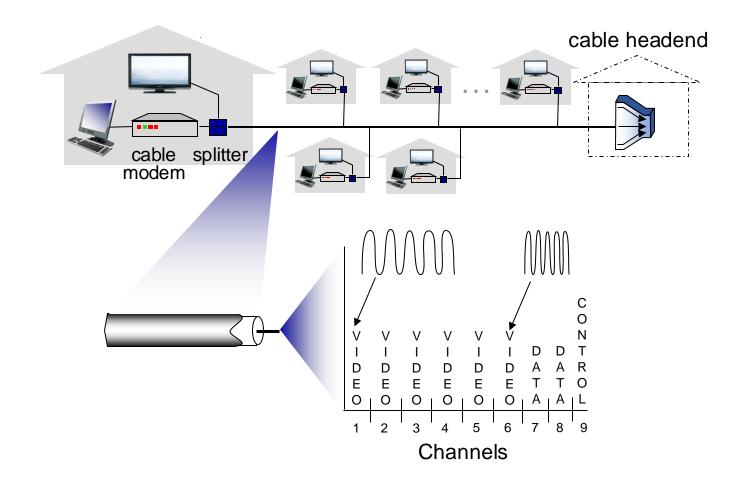

- residential access nets
- institutional access networks (school, company)
- mobile access networks (WiFi, 4G/5G)

What to look for:

- transmission rate (bits per second) of access network?
- shared or dedicated access among users?

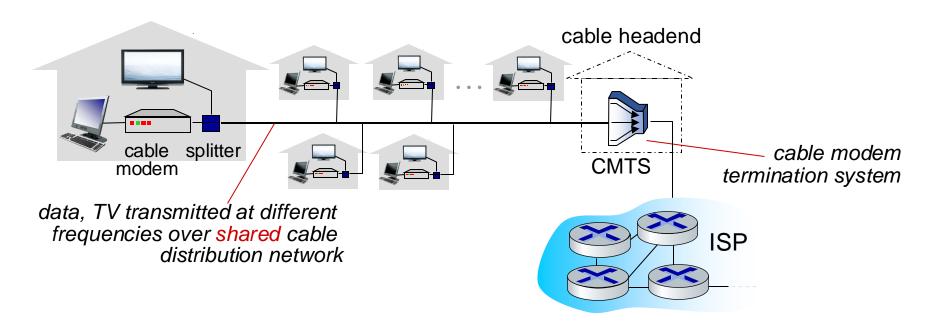

Access networks: cable-based access

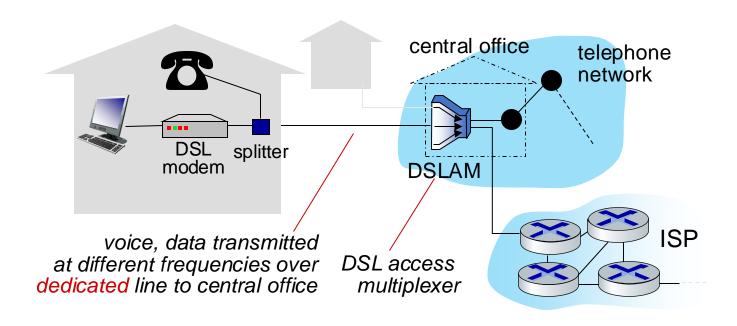

frequency division multiplexing (FDM): different channels transmitted in different frequency bands

Access networks: cable-based access

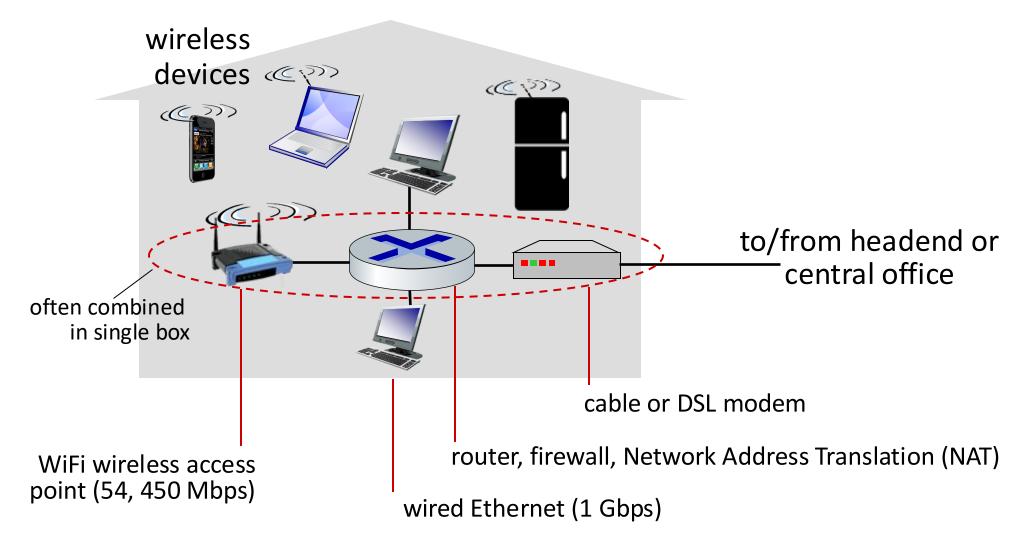

- HFC: hybrid fiber coax
 - asymmetric: up to 40 Mbps 1.2 Gbs downstream transmission rate, 30-100 Mbps upstream transmission rate
- network of cable, fiber attaches homes to ISP router
 - homes share access network to cable headend

Access networks: digital subscriber line (DSL)

- use existing telephone line to central office DSLAM
 - data over DSL phone line goes to Internet
 - voice over DSL phone line goes to telephone net
- 24-52 Mbps dedicated downstream transmission rate
- 3.5-16 Mbps dedicated upstream transmission rate

Access networks: home networks

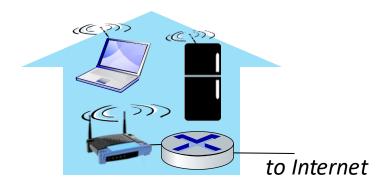

Wireless access networks

Shared wireless access network connects end system to router

via base station aka "access point"

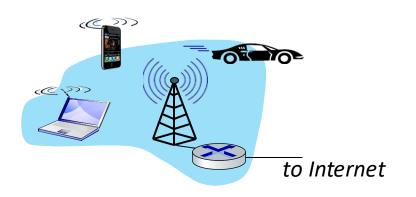

Wireless local area networks (WLANs)

- typically within or around building (~100 ft)
- 802.11b/g/n/ax (WiFi): 11, 54, 450
 Mbps, 9.6 Gbps transmission rate

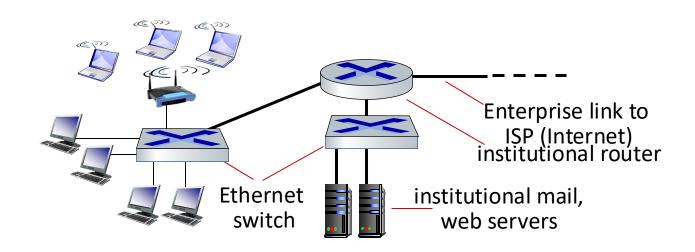

Wide-area cellular access networks

- provided by mobile, cellular network operator (10's km)
- 10's 100+ Mbps
- 4G, 5G cellular networks

Access networks: enterprise networks

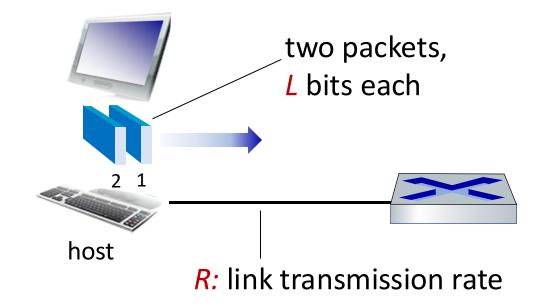

- companies, universities, etc.
- mix of wired, wireless link technologies, connecting a mix of switches and routers (we'll cover differences shortly)
 - Ethernet: wired access at 100Mbps, 1Gbps, 10Gbps
 - WiFi: wireless access points at 11, 54, 450 Mbps

Host: sends packets of data

host sending function:

- takes application message
- breaks into smaller chunks,
 known as packets, of length L bits
- transmits packet into access network at transmission rate R
 - link transmission rate, aka link capacity, aka link bandwidth

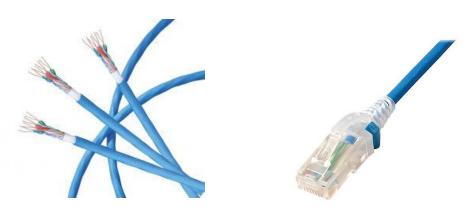

packet time needed to transmission = transmit
$$L$$
-bit = $\frac{L}{R}$ (bits/sec)

Links: physical media

- bit: propagates between transmitter/receiver pairs
- physical link: what lies between transmitter & receiver
- guided media:
 - signals propagate in solid media: copper, coax, fiber optics
- unguided media:
 - signals propagate freely, e.g., radio

Twisted pair (TP)

- two insulated copper wires
 - Category 5: 100 Mbps, 1 Gbps Ethernet
 - Category 6: 10Gbps Ethernet

Links: physical media

Coaxial cable:

- two concentric copper conductors
- bidirectional
- broadband:
 - multiple frequency channels on cable
 - 100's Mbps per channel

Fiber optic cable:

- glass fiber carrying light pulses, each pulse a bit
- high-speed operation:
 - high-speed point-to-point transmission (10's-100's Gbps)
- low error rate:
 - repeaters spaced far apart
 - immune to electromagnetic noise

Links: physical media

Wireless radio

- signal carried in electromagnetic spectrum
- no physical "wire"
- broadcast and "half-duplex" (sender to receiver)
- propagation environment effects:
 - reflection
 - obstruction by objects
 - interference

Radio link types:

- terrestrial microwave
 - up to 45 Mbps channels
- Wireless LAN (WiFi)
 - Up to 100's Mbps
- wide-area (e.g., cellular)
 - 4G cellular: ~ 10's Mbps
- satellite
 - up to 45 Mbps per channel
 - 270 msec end-end delay
 - geosynchronous versus lowearth-orbit

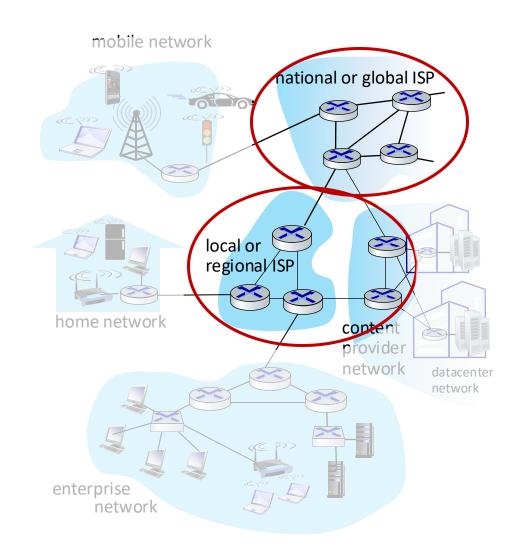

Chapter 1: roadmap

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

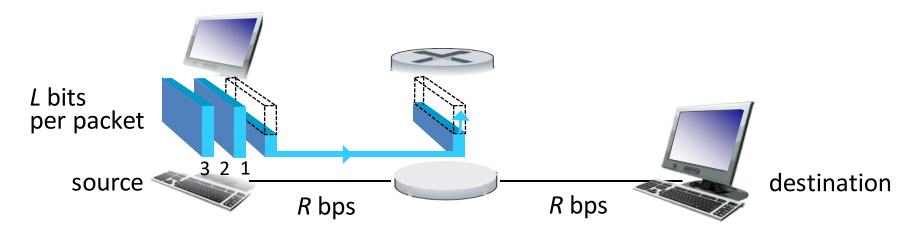

The network core

- mesh of interconnected routers
- packet-switching: hosts break application-layer messages into packets
 - forward packets from one router to the next, across links on path from source to destination
 - each packet transmitted at full link capacity

Packet-switching: store-and-forward

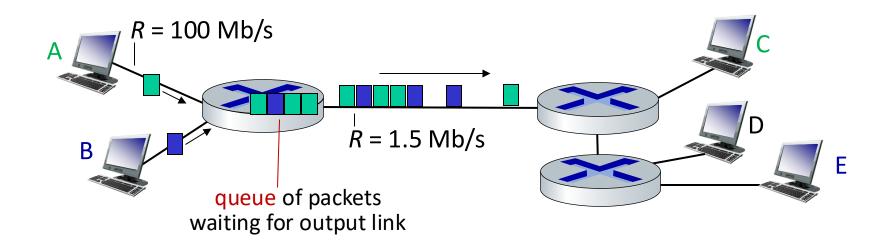

- Transmission delay: takes L/R seconds to transmit (push out) L-bit packet into link at R bps
- Store and forward: entire packet must arrive at router before it can be transmitted on next link
- End-end delay: 2L/R (above), assuming zero propagation delay (more on delay shortly)

One-hop numerical example:

- *L* = 10 Kbits
- *R* = 100 Mbps
- one-hop transmission delay= 0.1 msec

Packet-switching: queueing delay, loss

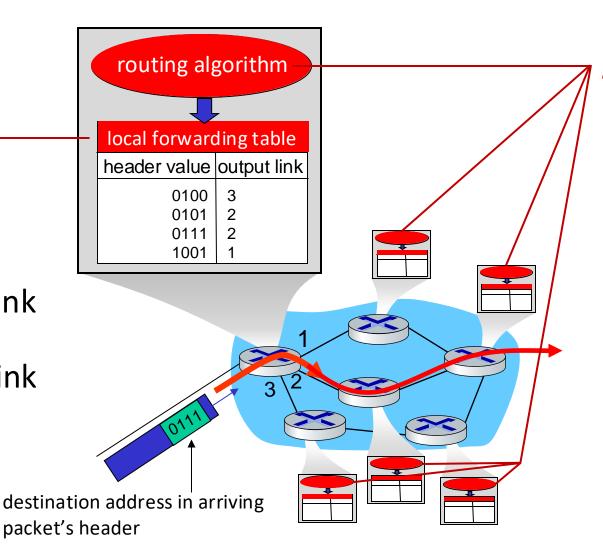

Packet queuing and loss: if arrival rate (in bps) to link exceeds transmission rate (bps) of link for a period of time:

- packets will queue, waiting to be transmitted on output link
- packets can be dropped (lost) if memory (buffer) in router fills up

Two key network-core functions

Forwarding:

local action: move arriving packets from router's input link to appropriate router output link

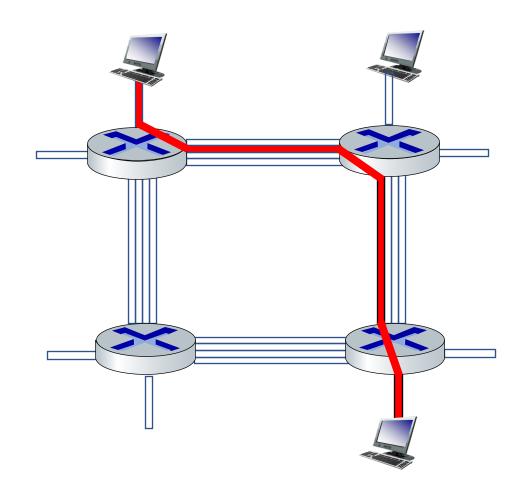

Routing:

- global action: determine sourcedestination paths taken by packets
- routing algorithms

Alternative to packet switching: circuit switching

end-end resources allocated to, reserved for "call" between source and destination

- in diagram, each link has four circuits.
 - call gets 2nd circuit in top link and 1st circuit in right link.
- dedicated resources: no sharing
 - circuit-like (guaranteed) performance
- circuit segment idle if not used by call (no sharing)
- commonly used in traditional telephone networks

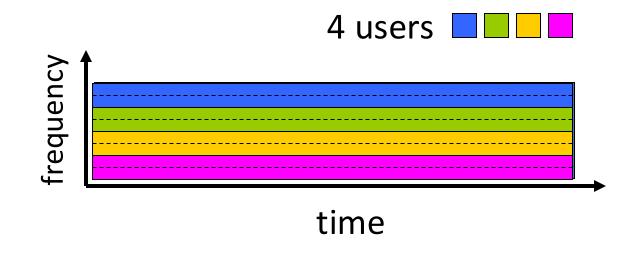

Circuit switching: FDM and TDM

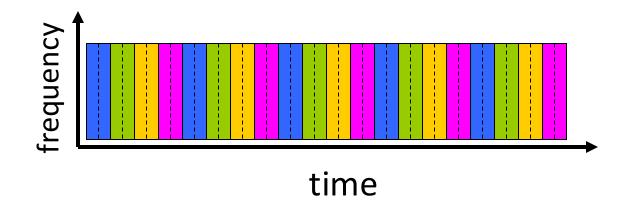

Frequency Division Multiplexing (FDM)

- optical, electromagnetic frequencies divided into (narrow) frequency bands
- each call allocated its own band, can transmit at max rate of that narrow band

Time Division Multiplexing (TDM)

- time divided into slots
- each call allocated periodic slot(s), can transmit at maximum rate of (wider) frequency band, but only during its time slot(s)

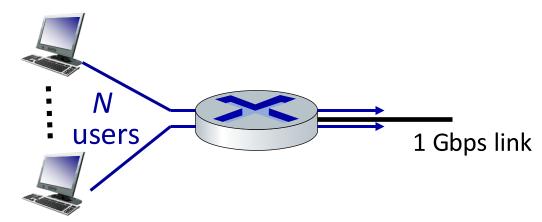

Packet switching versus circuit switching

packet switching allows more users to use network!

Example:

- 1 Gb/s link
- each user:
 - 100 Mb/s when "active"
 - active 10% of time
- circuit-switching: 10 users
- packet switching: with 35 users, probability > 10 active at same time is less than .0004 *

Q: how did we get the value 0.0004?

To find the probability that more than 10 users are active, you would sum the probabilities for k=11, k=12, ... up to k=35:

$$P(X>10) = \sum_{k=11}^{35} {35 \choose k} (0.1)^k (0.9)^{35-k}$$

Q: what happens if > 35 users?

^{*} Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose_ross/interactive

Packet switching versus circuit switching

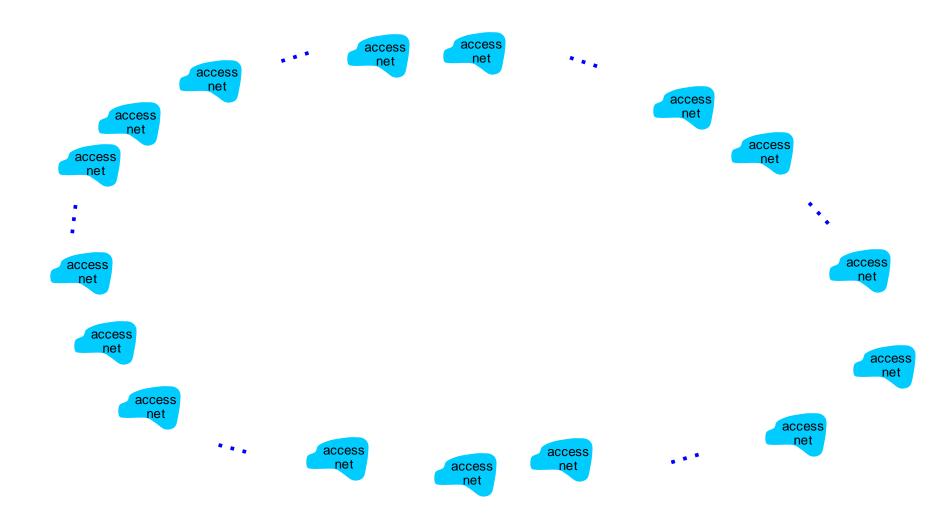

Is packet switching a "slam dunk winner"?

- great for "bursty" data sometimes has data to send, but at other times not
 - resource sharing
 - simpler, no call setup
- excessive congestion possible: packet delay and loss due to buffer overflow
 - protocols needed for reliable data transfer, congestion control
- Q: How to provide circuit-like behavior?
 - bandwidth guarantees traditionally used for audio/video applications

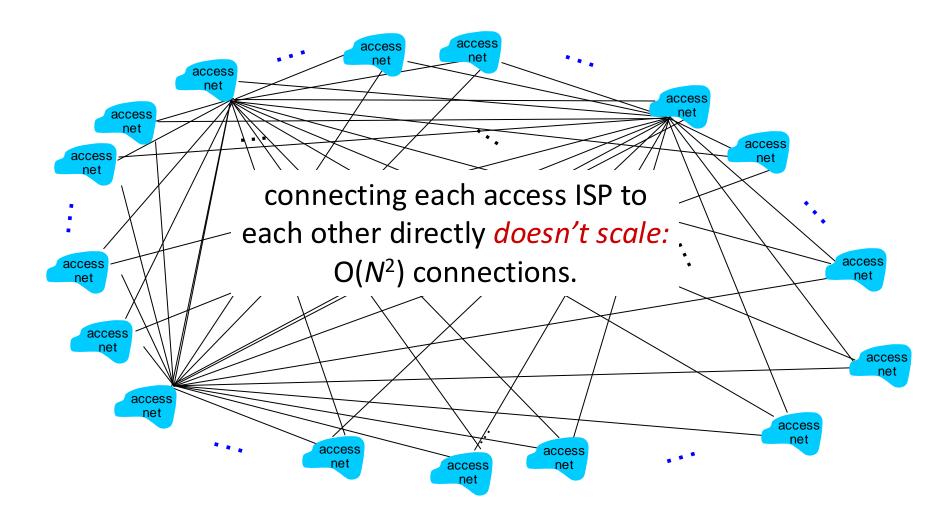

Q: human analogies of reserved resources (circuit switching) versus on-demand allocation (packet switching)?

- Hosts connect to Internet via access Internet Service Providers (ISPs)
 - residential, enterprise (company, university, commercial) ISPs
- Access ISPs in turn must be interconnected
 - so that any two hosts can send packets to each other
- Resulting network of networks is very complex
 - evolution was driven by economics and national policies
- Let's take a stepwise approach to describe current Internet structure

Question: given millions of access ISPs, how to connect them together?

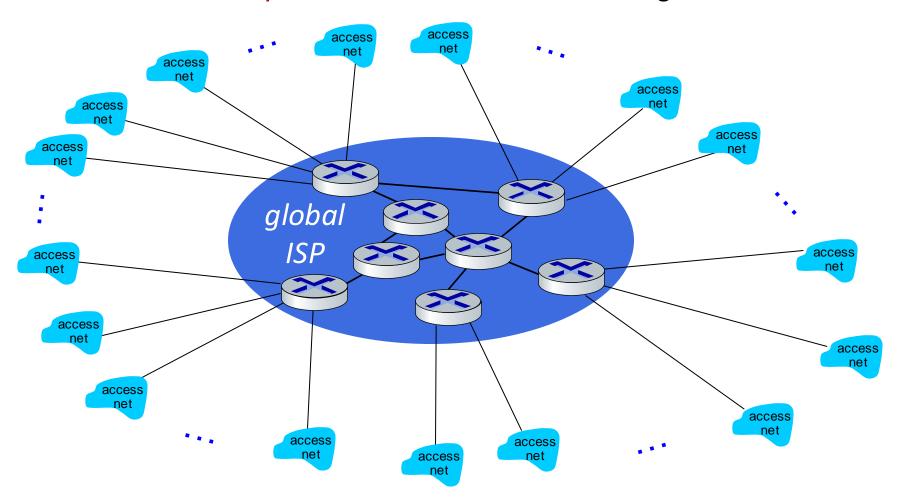

Question: given millions of access ISPs, how to connect them together?

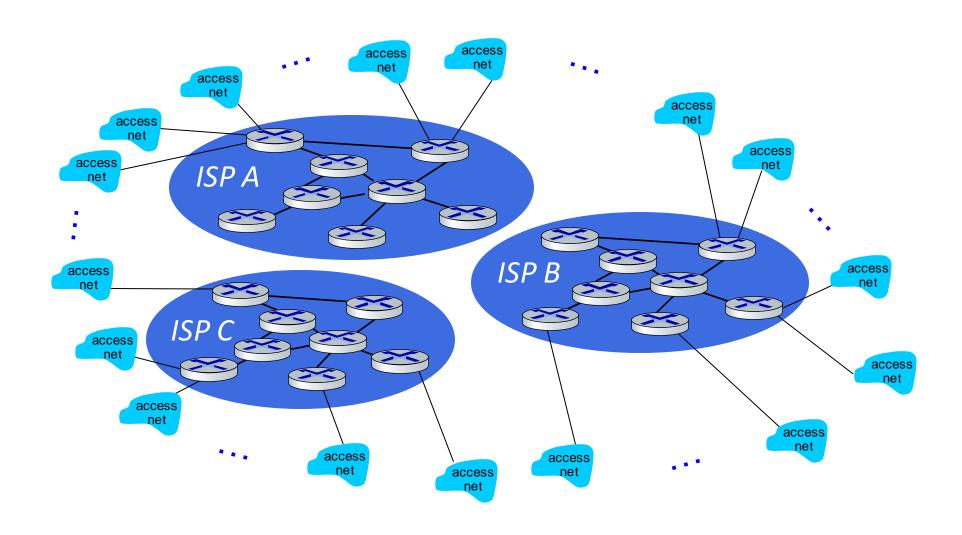

Option: connect each access ISP to one global transit ISP?

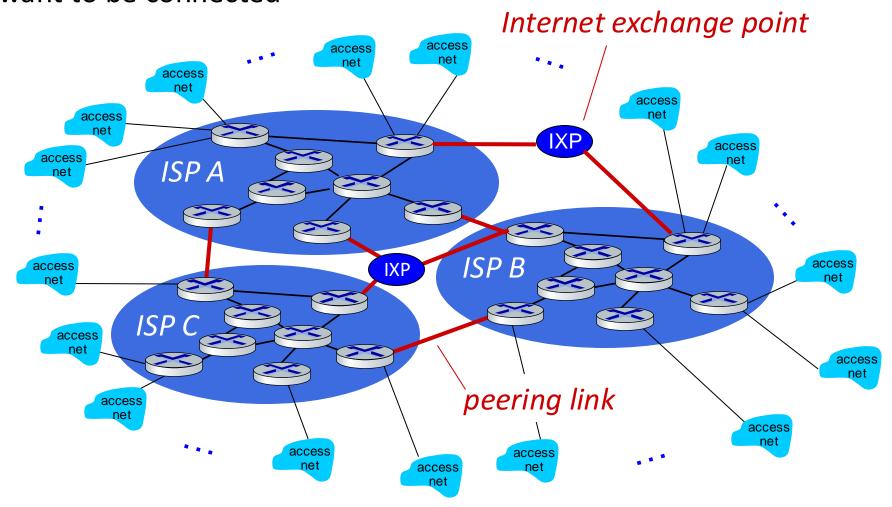

Customer and provider ISPs have economic agreement.

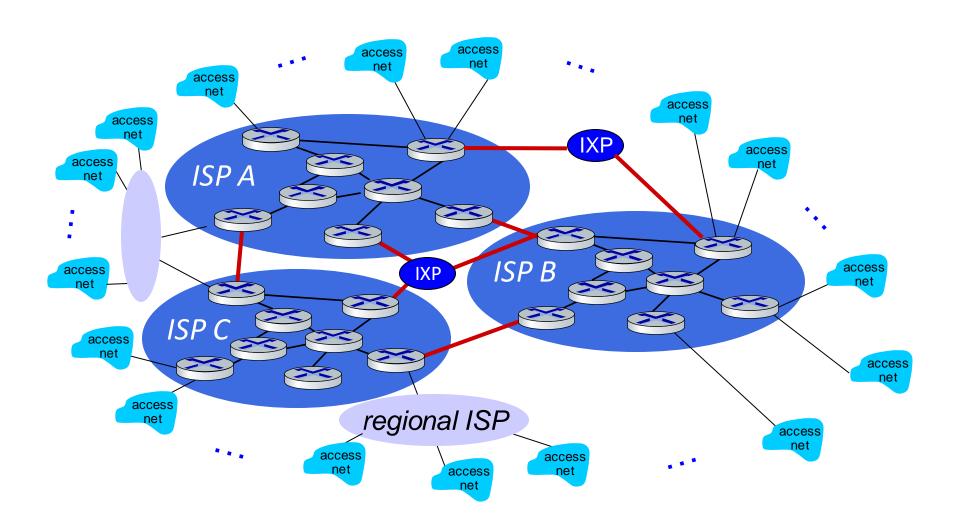

But if one global ISP is viable business, there will be competitors

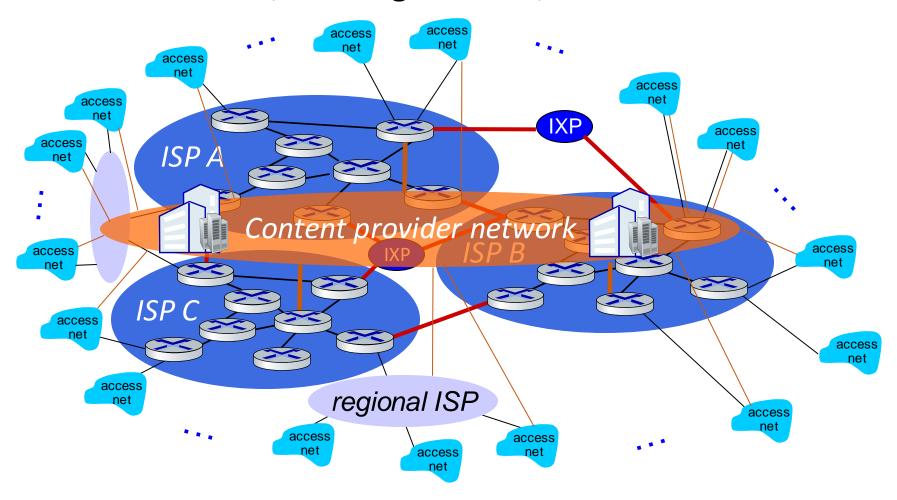

But if one global ISP is viable business, there will be competitors who will want to be connected

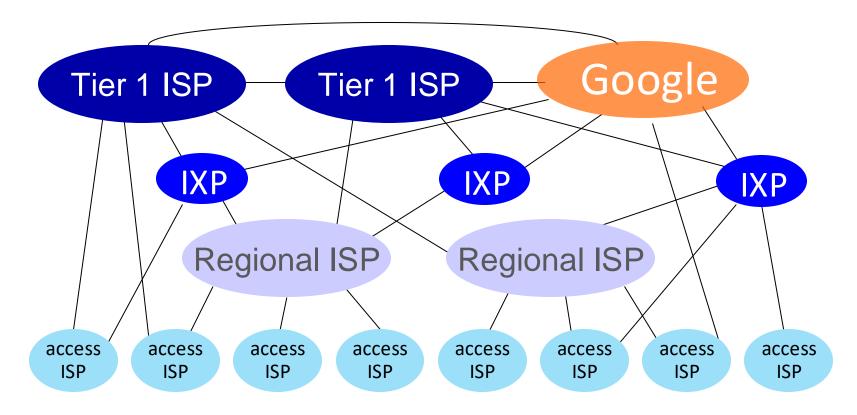

... and regional networks may arise to connect access nets to ISPs

... and content provider networks (e.g., Google, Microsoft, Akamai) may run their own network, to bring services, content close to end users

At "center": small # of well-connected large networks

- "tier-1" commercial ISPs (e.g., T-Mobile and AT&T), national & international coverage
- content provider networks (e.g., Google, Facebook): private network that connects its data centers to Internet, often bypassing tier-1, regional ISPs

Tier-1 ISP Network map: Sprint (2019)

Chapter 1: roadmap

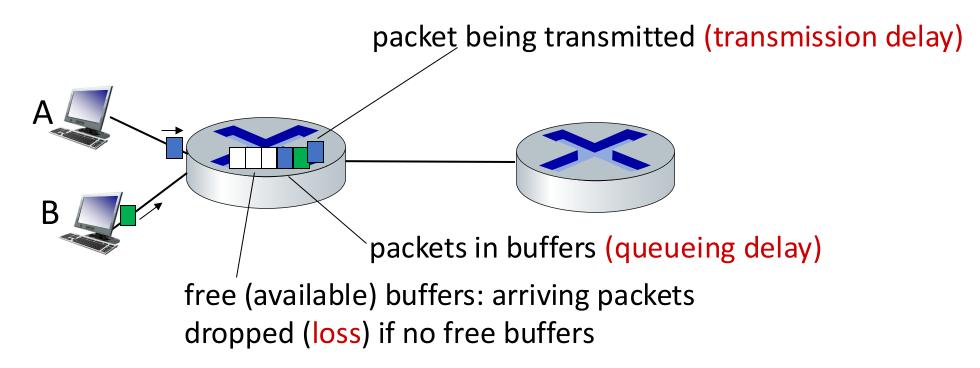

- What is the Internet?
- What is a protocol?
- Network edge: hosts, access network, physical media
- Network core: packet/circuit switching, internet structure
- Performance: loss, delay, throughput
- Security
- Protocol layers, service models
- History

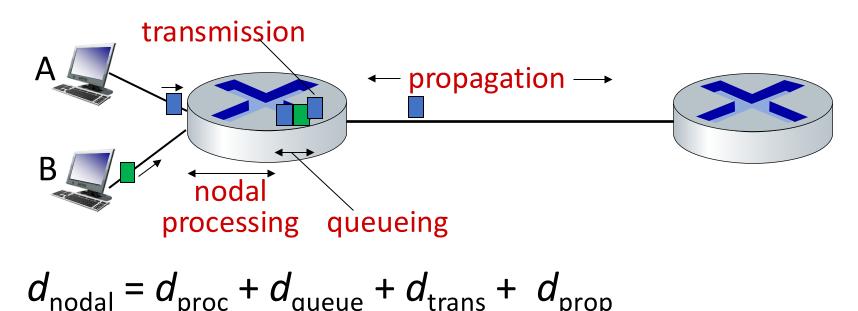

How do packet loss and delay occur?

packets queue in router buffers

- packets queue, wait for turn
- arrival rate to link (temporarily) exceeds output link capacity: packet loss

Packet delay: four sources

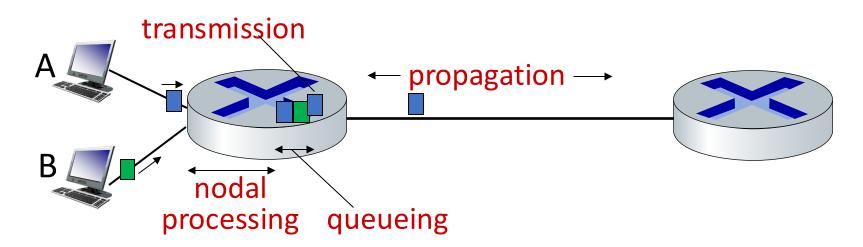

d_{proc} : nodal processing

- check bit errors
- determine output link
- typically < msec</p>

d_{queue} : queueing delay

- time waiting at output link for transmission
- depends on congestion level of router

Packet delay: four sources

$$d_{\text{nodal}} = d_{\text{proc}} + d_{\text{queue}} + d_{\text{trans}} + d_{\text{prop}}$$

d_{trans} : transmission delay:

- L: packet length (bits)
- R: link transmission rate (bps)

$$\frac{d_{trans} = L/R}{d_{trans}} = \frac{d_{prop}}{d_{trans}}$$
very different

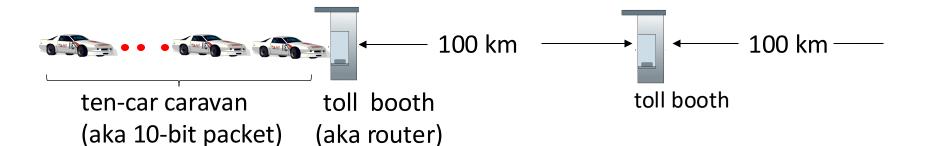

d_{prop} : propagation delay:

- d: length of physical link
- s: propagation speed (~2x10⁸ m/sec
 to 3 x 10⁸ m/sec)

$$d_{\text{prop}} = d/s$$

* Check out the online interactive exercises: http://gaia.cs.umass.edu/kurose_ross

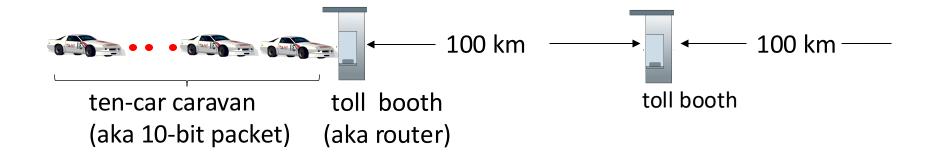

Caravan analogy

- cars "propagate" at 100 km/hr
- toll booth takes 12 sec to service car (bit transmission time)
- car ~ bit; caravan ~ packet
- Q: How long until caravan is lined up before 2nd toll booth?

- time to "push" entire caravan through toll booth onto highway = 12*10 = 120 sec
- time for last car to propagate from 1st to 2nd toll both: 100km/(100km/hr) = 1 hr
- *A:* 62 minutes

Caravan analogy

- suppose cars now "propagate" at 1000 km/hr
- and suppose toll booth now takes one min to service a car
- Q: Will cars arrive to 2nd booth before all cars serviced at first booth?
 A: Yes! after 7 min, first car arrives at second booth; three cars still at first booth

Packet queueing delay (revisited)

- R: link bandwidth (bps)
- L: packet length (bits)
- a: average packet arrival rate

- La/R ~ 0: avg. queueing delay small
- La/R -> 1: avg. queueing delay large
- La/R > 1: more "work" arriving is more than can be serviced - average delay infinite!
